

What is thread ?

A thread is a unit of the program workflow, each thread is running independently. Multithreaded tasks implemented separately, saving time, like a lot of people at the same time the division of labor to do some work. wbd using multi-threading technology, which is wbd can quickly **bulk download** network resources (**Images,music,video,pdf,office,etc**).

Multithreading can effectively improve the number of jobs, but also consumes system resources (CPU, memory, etc.), based on the speed of your network, computer hardware, adjust the number of threads.
